

Abstract

As we know ,Hashimoto's Thyroiditis is the commonest cause for sporadic Hypothyroidism in the regions with adequate iodine uptake. Because this disease has an autoimmune cause & its clinical features overlap with a series of another autoimmune diseases, for the same timely diagnosis & treatment of it, can be effective in prevention of probably complications , specially in pregnancy period.

This investigation includes some retrospective studies upon 50 patients with Hashimoto's Thyroiditis.

The causes of performance of this investigation are:

- Nevertheless the disease is the commonest agent for hypothyroidism but there is a little cognition about it.
- In case of timely diagnosis & treatment, its prognosis will be excellent & these patients will return to the ordinary life , but in case of existence any delay or some complications like myxedema coma , its mortality will be high.
